Subject: Re: Alternate folding P2/P4

me:

In discussing this whole area with Marjorie, she asked whether proteins synthesized in vitro would fold properly in extracts depleted of the known chaperonins (groE, dnaK etc) with antisera. Such an experiment is not so easy to set up (mainly because one would have to pry the appropriate sera out the owners, which in my experience is not trivial) but it might lead to interesting results. What do you think?
